

# Cloud IoT Energy Monitoring and Automation Platform

14-minute assessed presentation with live end-to-end simulation

**Evaluation only.**  
**Created with Aspose.Slides for Python via .NET 26.2.**

**Copyright 2004-2026Aspose Pty Ltd.**

**Member 1 - Intro**

**Member 2 - Logic**

**Member 3 - Demo**

**Telemetry -> decision -> control -> verification**

# Run of Show

Clear 14-minute pacing for 3 presenters

- 00:00-05:00 Presentation by Member 1 and Member 2
- 05:00-14:00 Live demo by Member 3
- Target: prove full loop, not only visualization

**Timeline** Final 40s reserved for crisp conclusion

Evaluation only.

## Member 1

Problem, architecture, firmware strategy

## Member 2

Automation rule, evidence, demo handoff

## Member 3

Live simulation and verification

# Why This Project Matters

From passive dashboards to active operations

- Many IoT systems only visualize data
- Operational decisions remain manual and delayed

- Tool fragmentation increases integration overhead

Low traceability makes audit difficult

**Created with Aspose.Slides for Python via .NET 26.2.**  
Copyright 2004-2026 Aspose Pty Ltd.

- Ingest live telemetry reliably
- Evaluate a deterministic 15-minute rule.

Dispatch control commands automatically

Verify every action through feedback and logs

**Our Objective**

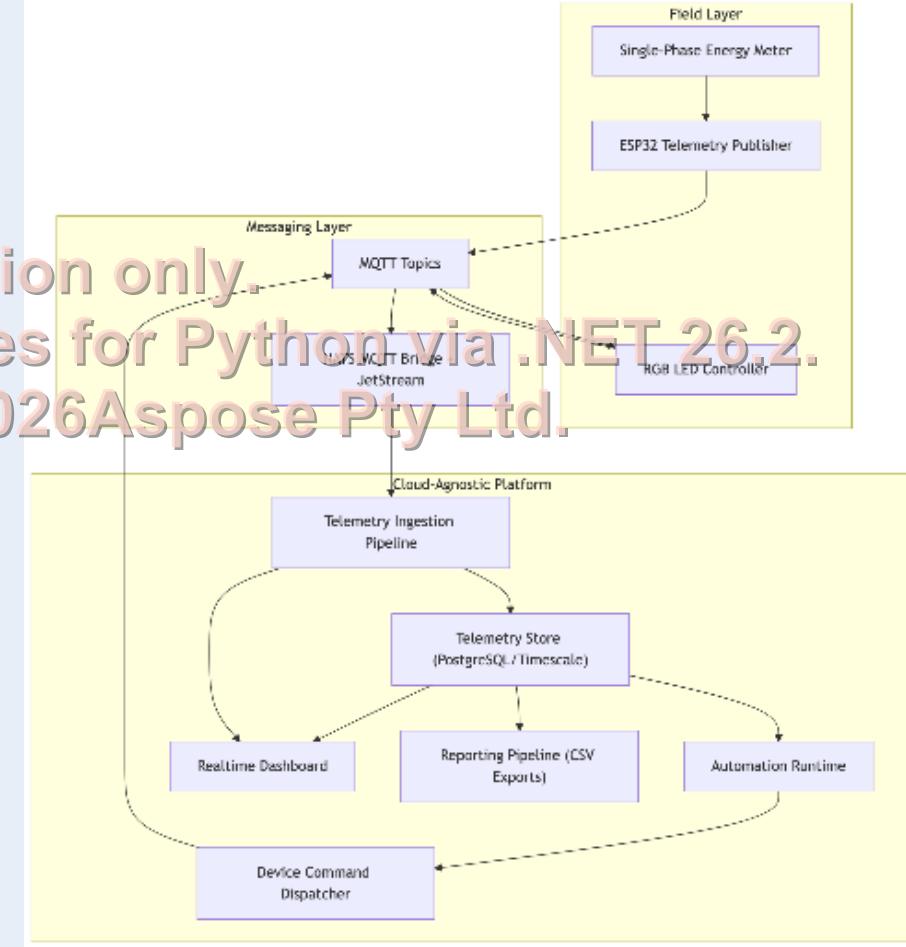

# End-to-End Platform Architecture

Single operational boundary for ingest, automation, control, and reporting

- Unified telemetry contract
- Near real-time condition evaluation
- Deterministic command lifecycle
- Shared source for dashboard + reports

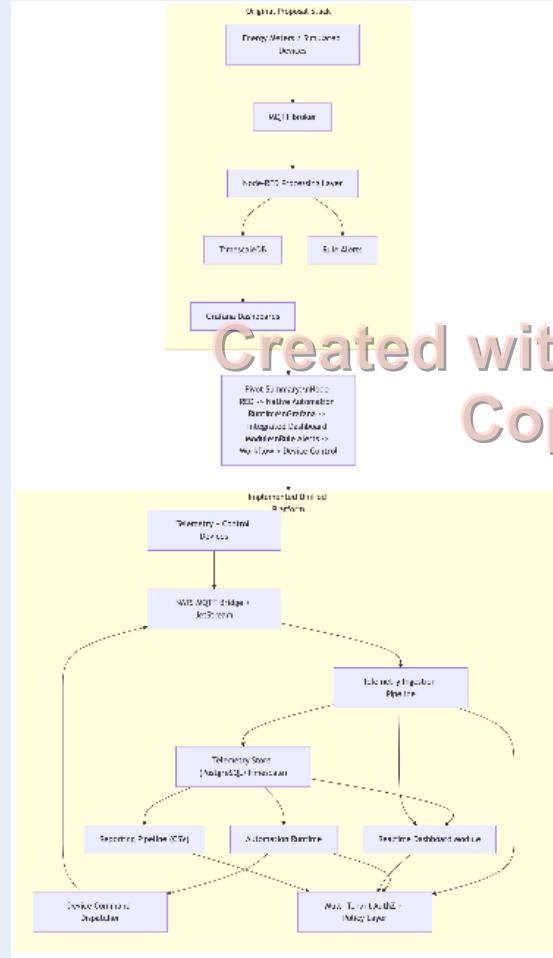

**What this architecture gives us**  
governance at team scale

*Evaluation only.

# Design Decision

## Why we moved from fragmented tools to an integrated platform

- One governance boundary for users, workflows, and evidence
    - Fewer integration seams to maintain under time pressure
  - Lower risk of mismatched schemas and policies
  - Faster onboarding of new devices using shared contracts
  - Cleaner story for assessment and real operations

# Firmware Strategy

Reusable ESP32 runtime + device-specific modules

- WiFi/MQTT lifecycle
- LWT + presence publishing
- Reconnect and retry behavior
- Shared telemetry envelope

## Common Runtime Layer

- RGB actuator: control + state acknowledgment
- PZEM meter: RS485 Modbus polling
- Read-only safety for meter.v1

## Device Modules

**Created with Aspose.Slides for Python via .NET 26.2.**

**Copyright 2004-2026 Aspose Pty Ltd.**

Same contract, easier future

# Automation Logic

15-minute energy rule drives deterministic control

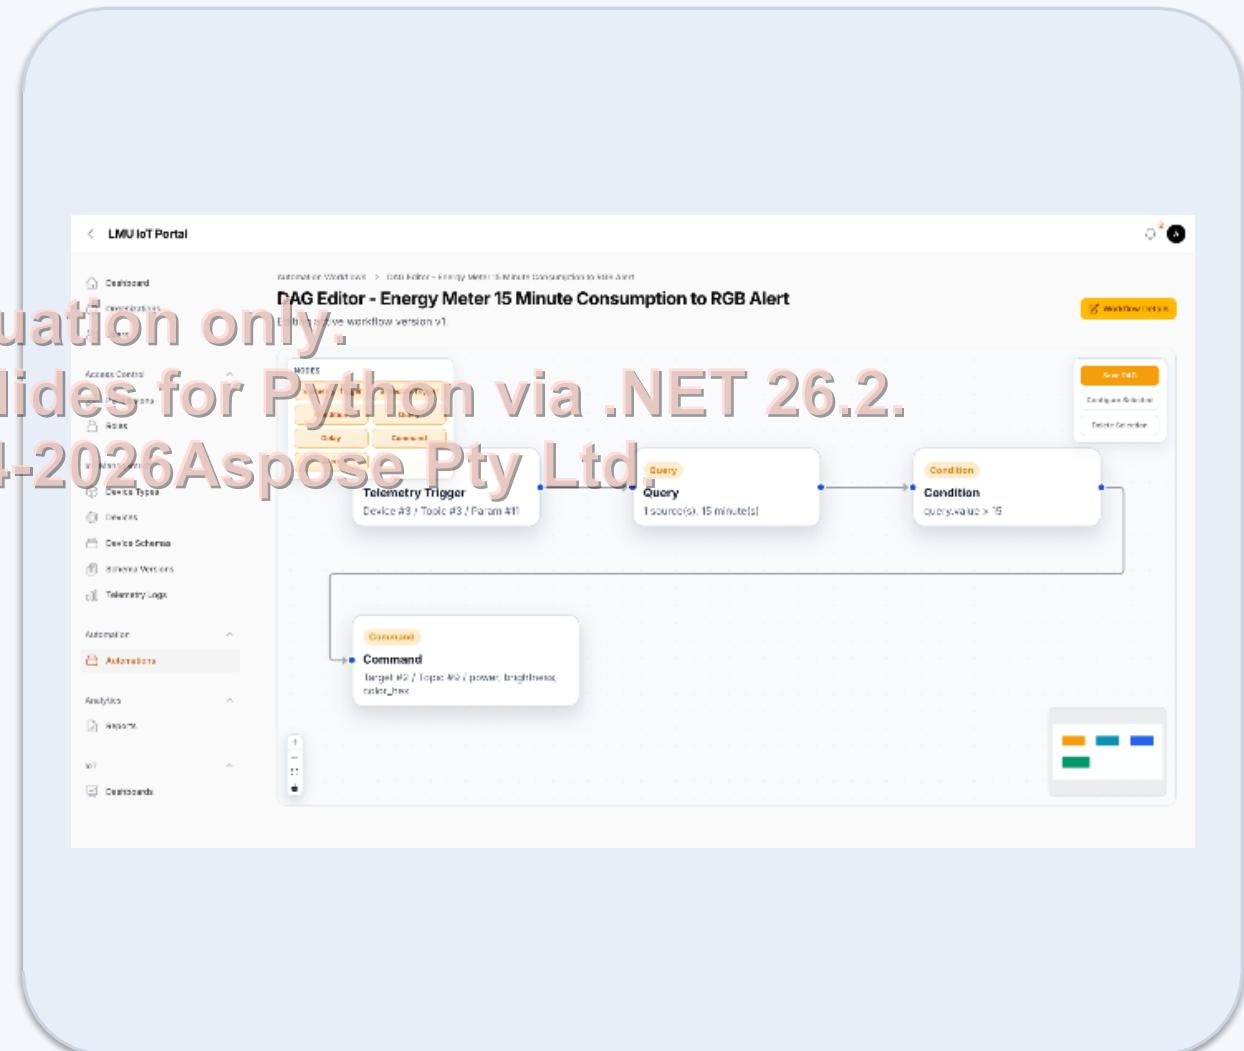

**Consumption (15 min) =  
MAX(total\_energy\_kwh) -  
MIN(total\_energy\_kwh)**

Created with Aspose.Slides for Python via .NET 26.2.

- If threshold passes -> dispatch RGB alert command
- If threshold fails -> no control side effects

## Branching behavior

- Every step stored in run-step records
- Command lifecycle reconciled with device feedback

# Live Demo Plan (Member 3)

9-minute simulation with measurable checkpoints

- 05:00-06:00 Baseline state and expected behavior
- 06:00-08:00 Simulated meter publishes rising telemetry
- 08:00-09:30 Rule threshold crosses and workflow fires
- 09:30-11:00 RGB command dispatch + acknowledgement
- 11:00-12:30 Lifecycle evidence + CSV report
- 12:30-13:30 Negative path: no command when rule fails
- 13:30-14:00 Conclusion

- Telemetry spike visible
- Rule passes
- Command dispatched

Feedback verified

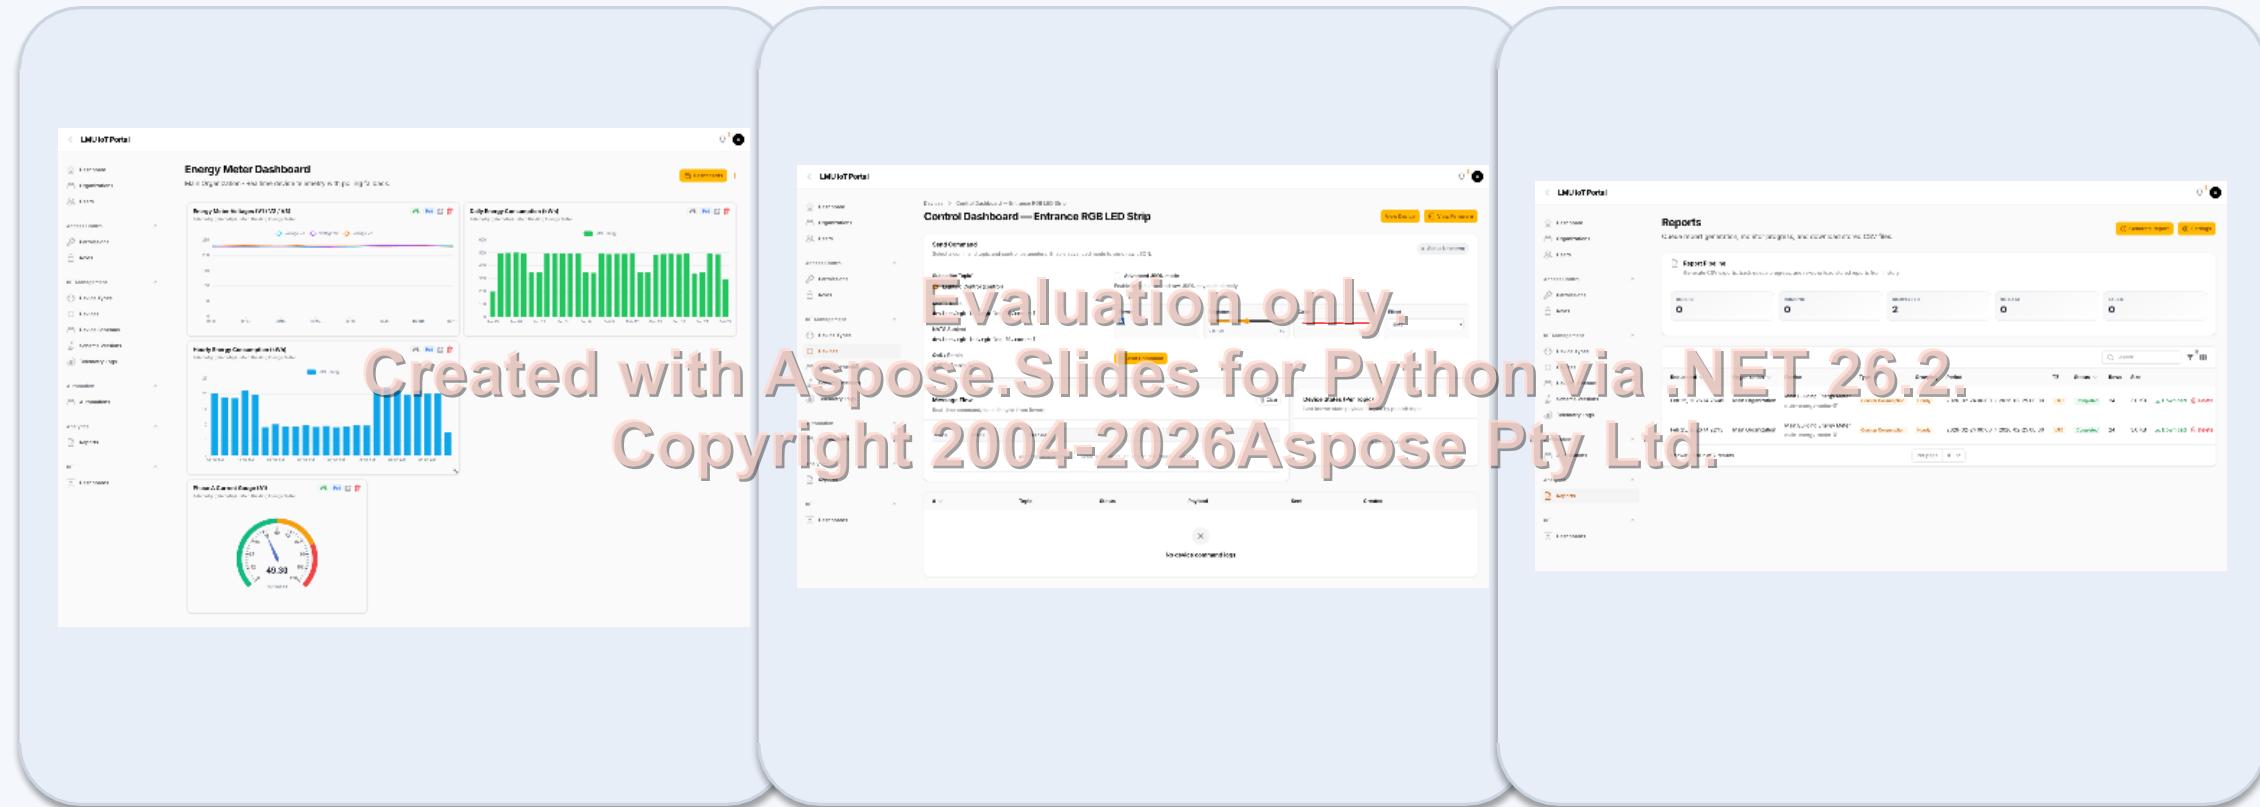

4 Success  
Checkpoints

## Minute-by-minute flow

*Evaluation only.

# Operational Evidence

What assessors should see during and after the demo

Realtime Dashboard

Control Lifecycle

Reporting Pipeline

Evidence chain: ingest -> evaluate -> command -> acknowledge -> export

# Demo Risk Control

Keep delivery stable even if live environment is noisy

- Service not ready -> verify tabs and baseline data 10 min before
- Simulation lag -> keep fallback snapshot tabs pre-opened
- Rule not triggering -> pre-check threshold and latest telemetry

**Live risks + mitigation** records as source of truth

- Use prepared screenshots in fixed order
- Keep the same 4 checkpoint narrative

• Show that each stage has stored evidence

Evaluation only.

Finish with the same closing statement

If live demo fails

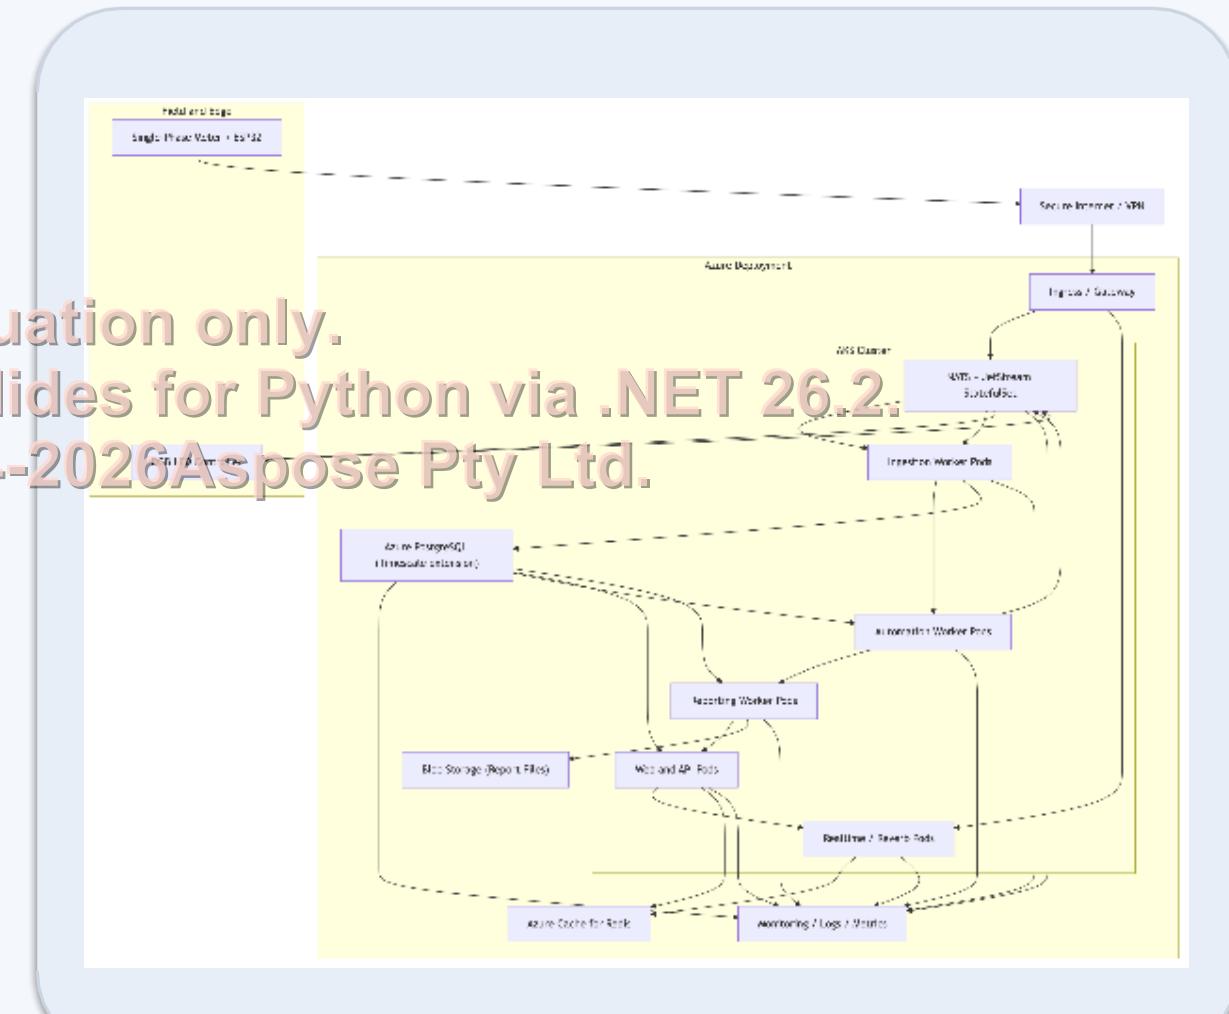

# Scalability and Portability

Designed for growth beyond a classroom prototype

- Cloud-agnostic deployment model
  - Kubernetes-ready service decomposition
  - Schema-based device onboarding
  - Queue-backed ingestion and report generation

# What scales well
